HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Introduction

Low-temperature-grown thin films are interesting for numerous applications in micro-electronics / photonics. The ability to grow materials whose refractive index can span a wide range of values facilitates the fabrication of optical multilayer stacks and, by proxy, of opto-electronic devices.

Here, we establish the deposition conditions of SiON thin films by Inductively-Coupled-Plasma Enhanced Chemical Vapor Deposition (ICP-PECVD) at low temperature (100°C) et demonstrate their use to create anti-reflective and mirror optica lcoatings.

Materials & processes

Silica (SiO_2), silicon nitride (Si_3N_4) and amorphous silicon (a-Si) are conventionally used materials for micro-electronics and photonics.

Here, we study two types of alloys

- $\text{SiO}_2/\text{Si}_3\text{N}_4$
- $\text{Si}_3\text{N}_4/\text{a-Si}$

The $\text{SiO}_2/\text{Si}_3\text{N}_4$ compounds are created by variation of the N_2O gas flux in the $\text{SiH}_4/\text{N}_2\text{O}/\text{N}_2$ gas mixture.

The $\text{Si}_3\text{N}_4/\text{a-Si}$ materials are obtained by modification of the plasma RF power for fixed SiH_4/N_2 gas injection.

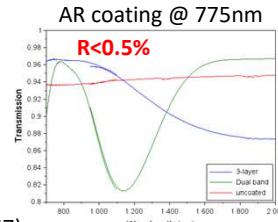

Optical thin-film coatings

Anti-Reflective coating

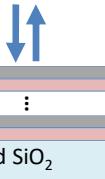

Design criteria

1. $R=0\%$
 2. Wide Bandwidth
- (1) $\Rightarrow n_2 \sim (n_{\text{subs}}/n_{\text{air}})^{0.5} * n_1$
(2) \Rightarrow low dispersion
 $\Rightarrow \text{SiON } \#1 = \text{SiO}_2$ (& $n_2 \sim 1.67$)

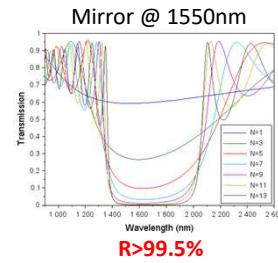

Mirror coating

Design criteria

1. $R>99\%$
 2. Wide Bandwidth
- (1) & (2) \Rightarrow high n_1/n_2
 $\Rightarrow \text{SiON } \#2 = \text{SiO}_2$ &
 $\text{SiON } \#1 = \text{high-Si Si-SiN}$

Conclusions

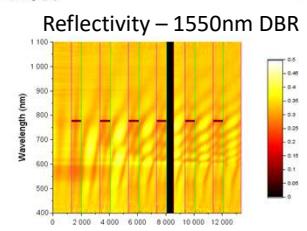

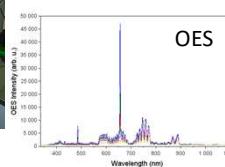

- ✓ Found the conditions to deposit mixed alloys between $\text{SiO}_2/\text{Si}_3\text{N}_4$ and $\text{Si}_3\text{N}_4/\text{a-Si}$
- ✓ Use real-time in-situ monitoring tools to gain insight into/monitor the depositions
- ✓ SiON layers with compositionally-adjustable refractive index between 1.48 to 2.78+i0.007 @ 775nm with roughness < 1nm
- ✓ Demonstrated multilayer coatings

Instrumented equipment

In-situ real-time characterisation tools:

- Optical Emission Spectroscopy
- Reflectometry

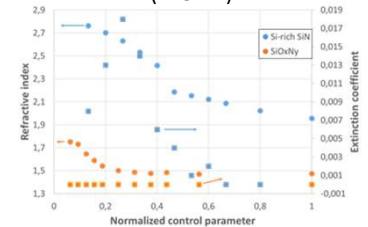

Material characterisation

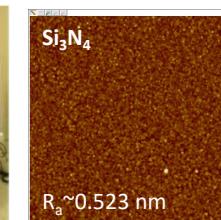

Ellipsometry

$n(775\text{nm})$

Atomic Force Microscope

Alloys	R_a (nm)
$\text{SiO}_2/\text{Si}_3\text{N}_4$	0.68-1.08
$\text{Si}_3\text{N}_4/\text{aSi}$	0.41-0.51
